adaptive filter resulting in an output y(n). The input is also sent through a delay to attain d(n). As the error signal is converging to zero, the adaptive filter coefficients w(n) are converging to the inverse of the unknown system u(n). For this configuration, as for the system identification configuration, the error can theoretically go to zero.

The adaptive filtering algorithms are essential in many statistical signal processing applications. Although the field of adaptive signal processing has been subject of research for over four decades, it was in the eighties that a major growth occurred in research and applications.

One key aspect of the adaptive FIR filter was that the minimum mean squared error (MMSE) solution is unique, i.e. the performance surface had exactly one minimum which was the bestor optimalsolution in an MMSE sense.

Adaptive information filtering is concerned with filtering information streams in dynamic (changing) environments. The changes may occur both on the transmission side — the nature of the streams can change — and on the reception side — the interests of the user (or group of users) can change.

The disadvantage of conventional subband adaptive filters is that delay introduced into the signal path by virtue of the bandpass

filters used to derive the subband signals. For active noise control, delay seriously limits the bandwidth over which good cancellation can be achieved.
