An Atlantis Ecosystem Model For

Atlantis is a 3D, spatially-explicit, trophodynamic ecosystem model that integrates biology, physics, chemistry and human impacts (e.g. the effects of fishing on ecosystem structure) to provide a synoptic view of marine ecosystem function. Atlantis is a sophisticated, data integration tool that allows users to assess the influence of biogeochemical processes and anthropogenic impacts on the ecosystem, as a whole.

Atlantis an ecosystem model that considers all parts of marine ecosystems – biophysical, economic and social.

Atlantis Ecosystem Model - Atlantis

Atlantis an ecosystem model that considers all parts of marine ecosystems – biophysical, economic and social. Originally focused on the biophysical world and then fisheries it has grown to begin to be used for multiple use and climate questions. Atlantis is a deterministic biogeochemical whole of ecosystem model.

Atlantis models are not intended to be used for tactical short-term advice such as setting quotas, but for strategic analyses or exploring options for ecosystem-based fisheries management. They summarize the current knowledge of an ecosystem given the model assumptions, identify trade-offs between management objectives, and test hypotheses.

One such model is the Atlantis Ecosystem Model (Atlantis), which can produce realistic simulations of ecosystem dynamics and serve as a strategic management tool for the exploration of ecological hypotheses, simulations of climate scenarios, and testing of human effects on the environment. These human effects include fisheries, tourism, extraction of natural resources, changes in land use, and nonpoint-source pollution.

As part of this program, we have parametrized an Atlantis ecosystem model for the Gulf of Mexico, including major functional groups, physiographic dynamics, and fishing fleets. The Gulf of Mexico (GOM) Atlantis model represents a collaboration between the University of South Florida, the University of Miami, the Southeast Fisheries Science ...

Atlantis Atlantis is a deterministic biogeochemical whole of ecosystem model. It's overall structure is based around the Management Strategy Evaluation approach, where there is a sub-model (or module) for each of the major steps in the adaptive management cycle (Figure 1).

Atlantis Ecosystem model Icelandic waters Sensitivity analysis Skill assessment ABSTRACT Icelandic waters are very productive and the fisheries are economically important for the Icelandic nation. The importance of the fisheries has led to progressive fisheries management and extensive monitoring of the eco-system.
