DSP | Applications | Processors | TI.com

Digital signal processing traditionally has been very useful in the areas of measurement and analysis in two different ways. One is to precondition the measured signal by rejecting the disturbing noise and interference or to help interpret the properties of collected data by, for instance, correlation and spectral transforms.

these applications, it is desirable to design a digital system which has linear phase.

Signal Processing Application - an overview ...

A very good example of complex signal processing is seen in digital systems that employ a front-end tuner. These systems fall into a category that can be loosely categorized as “ digital radio, ” in that an input wideband signal is tuned up or down in frequency and passed through a band pass or low pass filter to isolate some narrow band of interest.
