Those interested in learning how to run and diagnose Bayesian regression in R will find almost everything they need to know here. As with many R texts, Bayesian Computation with R has an accompanying package of functions available on CRAN (“ LearnBayes ”). The functions in this package are focused mainly on teaching Bayesian analysis, but also include some useful basic implementations.

Bayesian Computation with R introduces Bayesian modeling by the use of computation using the R language. The early chapters present the basic tenets of Bayesian thinking by use of familiar one and two-parameter inferential problems.

In the model, individuals are classed as susceptible (S), infected (and infectious) (I) or recovered (R). d S d t = − β S I / N d I d t = β S I / N − γ I d R d t = γ I where N = S + I + R. Daily counts of infected recovered individuals were simulated using the deterministic SIR model with β = 1.5, γ = 0.5, giving R 0 = 3.

Bayesian Computational Analyses with R is an introductory course on the use and implementation of Bayesian modeling using R software. The Bayesian approach is an alternative to the "frequentist" approach where one simply takes a sample of data and makes inferences about the likely parameters of the population. In contrast, the Bayesian approach uses both likelihood functions and a sample of observed data (the 'prior') to estimate the most likely values and distributions for the estimated ...
