In a short time, you'll be using sophisticated techniques and Python modules that are particularly effective for bioinformatics programming. Bioinformatics Programming Using Python is perfect for anyone involved with bioinformatics -- researchers, support staff, students, and software developers interested in writing bioinformatics applications. You'll find it useful whether you already use Python, write code in another language, or have no programming experience at all.

The book gives good introduction about practical computational skills using Python to process bioinformatics data. The book is very well organized for a newbie who just wants to start to process the raw data their own and get into a process of learning-by-doing to become a Python programmer.

JavaScript and PHP are great languages for web applications, but bioinformatics web applications should never be your first project. You could make a computational method in Python or R and then later make it into a web application, but that is not a project for a beginner.

In this article, a simple python script is provided that can be used to search for a specific character in a file. If you have a file consisting of some information including name, address, email, post, and so on. You want to extract only email addresses present in that file, then use the following script/block of code.

Biopython Tutorial - Tutorialspoint

One goal of this book is to help significantly expand Python's use for bioinformatics programming. Python features a syntax in which the ends of statements are marked only by the end of a line, and statements that form part of a compound statement are indented relative to the lines of code that introduce them. The semicolons or keywords that end statements and the braces that group statements in other languages are entirely absent.
