Bitcoin is probably the most well-known example of a public blockchain and it achieves consensus through "mining." In Bitcoin mining , computers on the network (or 'miners') try to solve a complex cryptographic problem to create a proof of work.

Blockchain security: What keeps your transaction data safe ...
Bitcoin blockchain structure A blockchain, originally block chain, is a growing list of records, called blocks, that are linked using cryptography. Each block contains a cryptographic hash of the previous block, a timestamp, and transaction data (generally represented as a Merkle tree). By design, a blockchain is resistant to modification of its data. This is because once recorded, the data in ...
