Facade design pattern is a good friend for building coarse-grained services (within the monolith) and then splitting them to smaller services. Continuous delivery changes once you own multiple microservices (and heck, people can actually OWN them now!), and how not to design for future (sharing via database is plain wrong and introduces ...

A book that is more about ideas behind microservices and fine grained systems than technology specifics. The key principles for microservice architectures: - You want services that are loosely coupled and highly cohesive - so find boundaries that help ensure that related behaviour is in one place and that communicate with other boundaries as loosely as possible.

Eas... (□□□□) Over the past 10 years, distributed systems have become more fine-grained. From the large multi-million line long monolithic applications, we are now seeing the benefits of smaller self-contained services. Heavy-weight, hard to change Service Oriented Architectures are not the answer; instead we are now seeing finer-grained systems consisting of collaborating microservices.
