1. Chapter 12 (Chapter 9 in your books) Stoichiometry 2. Section 12.1 The Arithmetic of Equations OBJECTIVES: • Explain how balanced equations apply to both chemistry and everyday life. • Interpret balanced chemical equations in terms of: a) moles, b) representative particles, c) mass, and d) gas volume (Liters) at STP. • Identify the quantities that are always conserved in chemical reactions. Stoichiometry is... •

Quantitative calculations involving reactions in solution are carried out in the same manner as we discussed in Chapter 11. Instead of masses, however, we use volumes of solutions of known concentration to determine the number of moles of reactants. Whether we are dealing with volumes of solutions of reactants or masses of reactants, the coefficients in the balanced chemical equation tell us ...

In the first oxide, 57.1 parts by mass of oxygen combine with 42.9 parts of carbon. 1 part of oxygen will combine with part of carbon = 0.751. Similarly in 2nd oxide. 1 part of oxygen will combine with part of carbon = 0.376. The ratio of carbon that combine with the same mass of oxygen =  $0.751 : 0.376 = 2 : 1$ .

1. Stoichiometry. 2. Limiting reagents and percent yield. NOTES: Stoichiometry is the calculation of chemical quantities from balanced equations. The four quantities involved in stoichiometric calculations are: • particles - the relative amounts of atoms, ions, unit formulas or molecules in various reactants or products • moles - the relative number of moles of reactants or products • mass - the relative masses of reactants or products • volume - the relative amounts of gaseous ...
