We aimed to evaluate the feasibility and efficacy of computed tomography (CT)-guided  
brachytherapy for patients with locoregional recurrent gastric cancer. Materials and methods:  
We reviewed the case histories of 28 patients with locoregional recurrent gastric cancer that  
were selected for CT- guided brachytherapy by a multidisciplinary team.

We describe how Computed Tomography (CT) scanners—that combine x-rays and computers to image soft tissues of the brain and other organs—have become a widely used diagnostic tool. Specifically, we chronicle the following: 1) development of the first CT scanner (through the early 1970s); 2) rapid and enthusiastic adoption of CT scanning (until the late 1970s); 3) regulatory backlash against ...

Adopting a problem-based approach, the reader is taken through a series of case histories. Starting with a short clinical description, each case includes one or more CT images followed by a description of the CT findings and a short explanation of the appropriate diagnosis.

Computed tomography (CT) is a well-established diagnostic imaging modality that has been in clinical use in medicine for several decades but only recently has become commonly used in veterinary medicine. The essential concept of a CT scanner is that an x-ray-generating tube is positioned across from a row of digital x-ray detectors in a ...

Tomography is imaging by sections or sectioning, through the use of any kind of penetrating wave. The method is used in radiology, archaeology, biology, atmospheric science, geophysics, oceanography, plasma physics, materials science, astrophysics, quantum information, and other areas of science. The word tomography is derived from Ancient Greek τομή tomos, "slice, section" and γραφία ...

A CT scan or computed tomography scan (formerly known as a computed axial tomography or CAT scan) is a medical imaging technique that uses computer-processed combinations of multiple X-ray measurements taken from different angles to produce tomographic (cross-sectional) images (virtual "slices") of a body, allowing the user to see inside the body without cutting.

A matched case-control sample of low-dose computed tomography (CT) studies in 186 participants with 4–20-mm noncalcified lung nodules who underwent biopsy in the National Lung Screening Trial (NLST) was selected. Variables used for matching were age, sex, smoking status, chronic obstructive pulmonary disease status, body mass index, study year of the positive screening test, and screening results.
