A data structure is a specialized format for organizing and storing data. A string uses an array as an underlying data structure to store bytes of characters. Therefore, it is a data structure, because it is a wrapper for an array of characters. Strings are all around us.

Humans think in Data structures: We, as humans, are wired to think in Data Structures. We just don't know it yet. Like I didn't. We just don't use term data structures to describe or while when we use them. Let us take a real-life example to see how humans think in terms of Data Structures.

Data Structures Tutorial for Beginners

The term data structure is used to denote a particular way of organizing data for particular types of operation. These notes will look at numerous data structures ranging from familiar arrays and lists to more complex structures such as trees, heaps and graphs, and we will see how their choice affects the efficiency of the algorithms based upon them.

Arrays are classified as Homogeneous Data Structures because they store elements of the same type. They can store numbers, strings, boolean values (true and false), characters, objects, and so on. But once you define the type of values that your array will store, all its elements must be of that same type. You can't "mix" different types of data.

Data Structures 101: Arrays – A Visual Introduction for ...

Data type is a way to classify various types of data such as integer, string, etc. which determines the values that can be used with the corresponding type of data, the type of operations that can be performed on the corresponding type of data. There are two data types ?

Big Data For Dummies Cheat Sheet. By Judith Hurwitz, Alan Nugent, ... Unstructured data is different than structured data in that its structure is unpredictable. Examples of unstructured data include documents, e-mails, blogs, digital images, videos, and satellite imagery. It also includes some data generated by machines or sensors.
