A Solid-state Power Supply/Modulator System MagCap Engineering Inc. Canton, MA New advances in high power insulated-gate bipolar transistor and FET technology have made the design of solid-state high power transmitters possible. Thyratrons have been used traditionally as the main high power switch in radar modulators.

Background. In the 1990s I was asked to design and build a power supply to provide a variable voltage DC power supply that would provide variable voltages at currents of up to 5 amps, for experiments in a Solid State Physics lab at Northumbria University. The voltage was required to be very stable and repeatable, with no significant temperature dependence, ripple or noise.

A power supply consists of basically three elements - the power transformer, the rectifier and the filter capacitors. Optionally, you could use a line filter before the power transformer, and possibly some method of soft switching if you have very large capacitor banks, so as to avoid blowing your line fuse every time you turn your power amp on.

~~Solid State Power Amplifier Supply Part 1~~

The first component of the power supply is the transformer. Using magnetic coupling between windings, the transformer is used to isolate the amplifier (and the users) from the mains voltage, and to reduce (for solid state equipment at least) the voltage to something the amplifier can tolerate.

360V AC x 1.414 = DC 509V (B+) The B+ supply Voltage from early valve rectifier power supplies drops as the output valves warm up and conduct current. Removing the output valves so no current is being taken from the power supply will cause the B+ Voltage to rise close to the academic formula. 360V AC x 1.414 = 509V DC.

A solid state power supply (more generally power converter) has semiconductors (diodes, various transistor types, IGBTs, thyristors, etc.) as par. Continue Reading. A transformer is one of two kinds of passive two or multi port electrical components. (The other one being a gyrator). In most cases it permits a galvanic insulation between input and output.

This thesis presents a solid state thyristor switched power supply capable of providing 50 kJ from a high voltage capacitor to a railgun. The efficiency with which energy is transferred from a power supply to a projectile depends strongly on power supply characteristics. This design will provide a better impedance match to the railgun
