The document points out that there are seven classes of synthetic designer drugs: cannabinoids, phenethylamines, phencyclidines or arylcyclohexamines, tryptamines, piperazines, pipradrols or N-Ring systems, and tropane alkaloids. A new review article in the Disease-A-Month journal explores these emerging drugs in detail.

Emerging drugs of abuse - what doctors should know

THC, the active ingredient in cannabinoids, can be detected in several different ways--it can be measured in sweat, urine, blood, hair, and oral fluid. In the emergency department, cannabis can be tested in the urine. It is important that the emergency physician consider synthetic cannabinoids or cannabinoids laced with other drugs of abuse.

Drugs of Abuse - Emergency Medicine Cases

Most of the deaths have occurred in conjunction with use of other medications, drugs abuse or alcohol. [2,3] The most common co-ingestants that have led to death are benzodiazepines, opioids and gabapentin, which is often used with kratom to enhance the opioid-like euphoria. However, at least one death was attributed solely to kratom use.
