During the formulation process, the quality, appearance, and stability of many creams and gels were affected by the highly reactive metal ions. A cream and two gels were found to be optimal for our purpose, and these were selected for further evaluation based on their physical properties, in vitro antibacterial activity, and product stability. Although only a small fraction of the formulated products were deemed optimal, a great achievement is that the integrity, pH values, texture ...

The main objective of the present investigation was to develop buccal tablets of ranipril, to bypass the first pass metabolism and to improve its oral bioavailability. Ranipril, an ACE inhibitor used in the treatment of hypertension undergoes extensive first pass metabolism and about 25% of the drug reaches the systemic circulation. A unidirectional, bilayered mucoadhesive tablet of ranipril ...

The formulation F3 prepared with sunflower wax was selected as optimized formulation on the basis of results of spreadability, viscosity, and hardness. The salicylic acid was used as model drug and incorporated in optimized formulation F3 and showed promising results for in vitro drug diffusion and ex vivo permeation through cellulose membrane and rat skin, respectively.

Optimized orally disintegrating tablets (ODTs) containing Paliperidone were prepared by direct compression method. Two factors, three levels (32) full factorial design was used to optimize the effect of superdisintegrant (crospovidone; X1) and; Binder (PVP K30S; X2) on tablet properties. The prepared ODTs were characterized for their drug content, hardness, friability and wetting time.
