In this research project we develop functional data analysis methods with the aim of analyzing movements in more detail (i.e., as functions), and measure reliability for such functional data. Using such methodology, we can obtain a more extensive interpretation of human movement, and e.g., compare interventions and evaluate the progress of rehabilitation.

Functional data analysis and applications to human movement  
The location at which an accelerometer is placed on the body is an important consideration in the measurement of body movement, with it normally attached to the part of the body whose movement is being studied. For example, accelerometers attached to the ankle and shin, are used to study leg movement during walking and accelerometers attached to the wrist have been used in the study of Parkinsonian tremor.
