Manning | Functional Programming in Java Functional programs contain no assignment statements, so variables, once given a value, never change. More generally, functional programs contain no side-effects at all. A function call can have no effect other than to compute its result. This eliminates a major source of bugs, and also makes the order of execution irrelevant—since no sideeffect can change an expression's value, it can be evaluated at any time.

Why Functional Programming? · Functional Programming in ...

Functional programming is an alternative style to the imperative which addresses the problems mentioned above. In this article we look at a simple example where a piece of imperative code with side effects (we'll understand what that means shortly) is transformed into the functional style by a sequence of refactoring steps.
