The fruit fly may provide a simple model in which to learn about blood-cell formation. Researchers have discovered a gene in the fruit fly that aids survival of developing blood cells. Because the gene shows striking conservation with a corresponding gene family in mammals, including humans, the scientists speculate that the fruit fly may provide a far simpler model in which to study blood-cell formation.

StarGenetics simulates genetic experiments using known model organisms such as Mendel's garden peas, flies (Drosophila melanogaster), and yeast (Saccharomyces cerevisiae). StarGenetics simulate crosses in cows, which can be use to explore traits in organisms with similar genetics to humans. In addition, StarGenetics can simulate crosses between non-model organisms such as "smiley faces", which are typically used for introducing genetic concepts to younger audiences.

Researchers unveil the complete genetic sequence of one of the workhorses of modern biology. The common fruit fly, Drosophila melanogaster, has been the workhorse of biology and genetics laboratories for the past 90 years. Now the entire Drosophila genome has been sequenced through the collaborative effort of researchers from the Drosophila Genome Project Group, led by Howard Hughes Medical Institute (HHMI) vice president Gerald Rubin at the University of California Berkeley, and researchers ...
