Inflammatory bowel disease (IBD) is a term mainly used to describe 2 conditions: ulcerative colitis and Crohn's disease. Ulcerative colitis and Crohn's disease are long-term conditions that involve inflammation of the gut. Ulcerative colitis only affects the colon (large intestine). Crohn's disease can affect any part of the digestive system, from the mouth to the bottom (anus).

Inflammatory bowel disease - NHS - NHS

Inflammatory bowel disease (IBD) is a group of inflammatory conditions of the colon and small intestine. Crohn's disease and ulcerative colitis are the principal types of inflammatory bowel disease. Crohn's disease affects the small intestine and large intestine, as well as the mouth, esophagus, stomach and the anus, whereas ulcerative colitis primarily affects the colon and the rectum.

Inflammatory bowel disease - Wikipedia

Inflammatory bowel disease (IBD) is a term for two conditions (Crohn's disease and ulcerative colitis) that are characterized by chronic inflammation of the gastrointestinal (GI) tract. 1 Prolonged inflammation results in damage to the GI tract. Some of the differences between Crohn's disease and ulcerative colitis:

CDC -What is inflammatory bowel disease (IBD) ...

When doctors talk of inflammatory bowel disease they usually mean people who either have Crohn's disease or ulcerative colitis. Both these conditions can cause inflammation of the colon and rectum (large bowel or large intestine) with similar symptoms, such as bloody diarrhoea, etc.

Inflammatory Bowel Disease | Symptoms and Treatment | Patient

Back To Top Symptoms of inflammatory bowel disease (IBD) can include diarrhea, blood in the stool, weight loss, and abdominal pain. The type and location of abdominal pain is different, not only between the two main forms of IBD (Crohn's disease and ulcerative colitis) but also within the subtypes of these diseases.
