As you already know, statistics is the application of the

laws of probability to real, actual data. If you take the D20 example, this would be when you roll the dice 20 times and collect some data.

When you apply probability to real data, you are trying

to determine if the outcome is significantly different from a model that you are generating.

A probability of one
represents certainty:
if you flip a coin, the
probability you'll get
heads or tails is one
(assuming it can't

some such). The

probability of getting
a given number of

heads from four flips

is, then, simply the

number of ways that

number of heads can

occur, divided by the

rather than just black-box application, of advanced statistical methods with a focus on medical applications.

Students may use either R or SAS statistical software.
