Ishihara Test for Color Blindness

The Ishihara test is used to detect the most common types of colour blindness, which are categorised as
red-green colour deficiencies (known as protanomaly and deuteranomaly). This is a general term that
covers a range of types and severities, but in general means that people are unable to see or differentiate
colours that have red or green as part of the whole colour.

How do Ishihara tests detect colour blindness? | Specsavers UK

The Ishihara test is a color perception test for red-green color deficiencies, the first in a class of successful
color vision tests called pseudo-isochromatic plates. It was named after its designer, Shinobu Ishihara, a
professor at the University of Tokyo, who first published his tests in 1917. The test consists of a number
of colored plates, called Ishihara plates, each of which contains a circle of dots appearing randomized in

Ishihara's Tests for Colour Blindness - 14 Plate set ...

The most common way to test for color blindness is known as the Ishihara Color Test. Dr Shinobu Ishihara, a University of Tokyo professor, created a series of plates to be used to identify red green color blindness. As you see in the image below, they contain a series of 38 plates; however an issue is normally well apparent after only a few.
