# Online Library Lactic Acid Bacteria Fermentation Starter Culture Development

The production of fermented foods today is based on the use of lactic acid bacteria (LAB) as starter cultures, in order to initiate and provide controlled and predictable fermentation. LAB starters are primarily used because of their ability to produce lactic acid from lactose, and for consequent pH reduction, but also for their ability to improve the quality and functionality of fermented foods.

## *Lactic acid bacteria as starter cultures - Starter ...*

Lactic acid bacteria (LAB) are members of an heterogenous group of bacteria which plays a significant role in a variety of fermentation processes. The general description of the bacteria included in the group is gram-positive, non-sporing, non-respiring cocci or rods.

## *Lactic acid bacteria as starter cultures: An update in ...*

At present, the process of lactic acid fermentation as a biological method for conservation of fungal fruiting bodies is not commonly used on an industrial scale, although this was a very popular way of extending the durability of mushroom raw material in the middle of the last century.

Species of lactic acid bacteria (LAB)

# Online Library Lactic Acid Bacteria Fermentation Starter Culture Development

represent as potential microorganisms and have been widely applied in food fermentation worldwide. Milk fermentation process has been relied on the activity of LAB, where transformation of milk to good quality of fermented milk products made possible. The presence of LAB in milk fermentation can be either as spontaneous or inoculated starter cultures.

## *The Role of Lactic Acid Bacteria in Milk Fermentation*

Lactic acid bacteria constitute a diverse group of industrially significant, safe microorganisms that are primarily used as starter cultures and probiotics, and are also being developed as production systems in industrial biotechnology for biocatalysis and transformation of renewable feedstocks to commodity- and high-value chemicals, and health products.

## *Lactic acid bacteria: from starter cultures to producers ...*

Fermentation with lactic acid bacteria (LAB) is a cheap and effective food preservation method that can be applied even in more rural/remote places, and leads to improvement in texture, flavor and nutritional value of many food products.

## *Lactic Acid Bacteria as Starter-Cultures for Cheese ...*

acid bacteria and yeast, are involved in

fermentation, during which the variety and quantity of microorganisms constantly change (Zhao, Li, Jiang, Deng, & Kneifel, 2016). To provide uniform fermented products, selecting suitable strains to initiate fermentation is necessary. Various LABs have been used as starter culture, including *Lactobacillus brevis*

*Sichuan paocai fermented by mixed-starter culture of ...*

AIM: To evaluate the suitability of marine lactic acid bacteria (LAB) as starter cultures for *Sargassum* sp. fermentation to enhance its antioxidant and anticoagulation activity. METHODS AND RESULTS: LAB isolated from marine source were characterized for their ability to utilize seaweed as a sole carbon source and applied to *Sargassum* fermentation.

*Potential of marine lactic acid bacteria to ferment ...*

Characteristics. The lactic acid bacteria (LAB) are either rod-shaped (), or spherical (), and are characterized by an increased tolerance to acidity (low pH range). This aspect helps LAB to outcompete other bacteria in a natural fermentation, as they can withstand the increased acidity from organic acid production (e.g., lactic acid). Laboratory media used for LAB typically include a ...

## *Lactic acid bacteria - Wikipedia*

The lactic acid bacteria metabolize sugars that the yeast cannot, while the yeast metabolizes the by-products of lactic acid fermentation. [63] [64] During sourdough fermentation, many cereal enzymes, particularly phytases, proteases and pentosanases, are activated through acidification and contribute to biochemical changes during sourdough fermentation.

## *Sourdough - Wikipedia*

Single-strain starter cultures of lactic acid bacteria do influence the flavour profile of type II sourdoughs. Selected strains of lactic acid bacteria produce distinct flavours, such as acidic, buttery, and fruity flavours. Rye fermentation results in sourdoughs richer in volatiles than wheat fermentations.

## *Prevalence and impact of single-strain starter cultures of ...*

We aimed at isolating lactic acid bacteria (LAB) from different plant materials to study their crossed-fermentation capacity in silos and to find strains able to confer enhanced aerobic stability to silage. A total of 129 LAB isolates were obtained from lucerne (alfalfa), maize, sorghum, ryegrass, rice, barley, canola, Gatton panic, Melilotus albus, soy, white clover, wheat, sunflower, oat ...

## *Frontiers | Potential of Lactic Acid Bacteria Isolated ...*

The population of halophilic lactic acid bacteria was monitored using LA13 medium (Yamasato and Iizuka, 1959) with a slight modification, containing 1% polypeptone, 0.4% yeast extract, 1% KH<sub>2</sub>PO<sub>4</sub>, 12% NaCl, 0.5% glucose, 5% soy sauce (Yamasa, Choshi, Japan) and 1.5% agar. Starter cultures or fish sauce mashes taken at various fermentation periods were diluted with 10% saline, spread on the LA13 medium and incubated at 30 °C for 5 days with an AnaeroPack (Mitsubishi Gas Chemical) in a ...

### *Isolation of halophilic lactic acid bacteria possessing ...*

Results indicated that the predominant microorganisms in the inoculated treatments were lactic acid bacteria, while yeasts predominated in control. As a consequence, starter culture contributed to a crucial effect on olives fermentation, leading to faster acidification and lower pH.

### *Benefits of the Use of Lactic Acid Bacteria Starter in ...*

Fermentation by lactic acid bacteria is helpful in reducing soy protein immunoreactivity. However, how lactic acid fermentation influences the gastroduodenal digestibility and immunoglobulin E (IgE) binding capacity of soy proteins remains unclear. In this study, the protein digestion

The homofermentative lactic acid bacteria such as *Lactococcus* and *Streptococcus* yield two molecules of lactates from one glucose molecule whereas heterofermentative lactic acid bacteria such as...

*Lactic Acid Bacteria: Probiotic Characteristic, Selection ...*

Acid production is the major function of the starter bacteria. Lactic acid is responsible for the fresh acidic flavor of unripened cheese and is important in coagulation of milk casein, which is accomplished by the combined action of rennet (an enzyme) and lactic acid produced by the microbes.

*Lactic Acid Bacteria - Textbook of Bacteriology*

Among them, yeasts and lactic acid bacteria (LAB) are important communities. The study examined the isolated strains from fermented grains of Baijiu regarding their activity of  $\alpha$ -amylase and glucoamylase, ethanol tolerance, glucose utilization, as well as metabolite production in the process of laboratory-scale sorghum-based fermentation.
