Short, concise, and easily-accessible, this book uses the 8085A microprocessor and 8051 microcontroller to explain the fundamentals of microprocessor architecture, programming, and hardware. It features only practical, workable designs so that readers can develop a complete understanding of the application with no frustrating gaps in the explanations.

The main difference between a microcontroller and microprocessor is the presence of necessary peripheral or components like RAM, ROM, EEPROM, etc inside a single IC chip. Due to the compact design of microcontroller, they are used in mini portable electronic gadgets, toys and devices.

~~Microprocessor Tutorial~~—Tutorialspoint

A Microcontroller is a small and low-cost microcomputer, which is designed to perform the specific tasks of embedded systems like displaying microwave information, receiving remote signals etc. The general microcontroller consists of the processor, the memory (RAM, ROM, EPROM), Serial ports, peripherals (timers, counters) etc.
