Summary. Cytomegalovirus (CMV) produces widely variable pathologic change in infected tissues, whether in the context of acquired immunodeficiency syndrome (AIDS) or another form of immunosuppression, e.g., that noted after organ or bone marrow transplantation.

Author information: (1)Institute for Molecular Virology and McArdle Laboratory for Cancer Research, University of Wisconsin-Madison, Madison, Wisconsin, USA. Human cytomegalovirus (HCMV) is a significant human pathogen that achieves lifelong persistence by establishing latent infections in undifferentiated cells of the myeloid lineage, such as CD34(+) hematopoietic progenitor cells.
