Clinical Significance of motor control and learning. Motor control and learning help therapists to understand the process behind movements, motor tasks and skills. By acknowledging the theories of motor learning and control and integrating them into day- to- day practice, therapists will have better chance of: identifying issues in motor performance,

Motor Learning study focuses on the behavioral, biomechanical, and neural bases of development, acquisition, and performance of functional movement skills. Acquisition of skill is examined over the life span in typically developing children and adults and individuals with movement disorders. Movement analysis is used to elucidate the neuromotor control processes underlying skilled performance in everyday functional behaviors.

Management of motor control impairments around the shoulder girdle. Motor learning refers to the processes associated with practice or experience that lead to the acquisition/reacquisition of relatively permanent movement capability (Schmidt & Lee 2005, Shumway-Cook & Woollacott 2007). Rehabilitation strategies should be tailored to the individual's goals and specific neuromuscular impairments and motor control capabilities that may vary in different body segments and over different tasks.

movements that reflect changes in the structure and function of the nervous system. Motor learning occurs over varying timescales and degrees of complexity: humans learn to walk or talk over the course of years, but continue to adjust to changes in height, weight, strength etc. over their lifetimes. Motor learning enables animals to gain new skills, and improves the smoothness and accuracy of movements, in some cases by calibrating simple

Motor Learning and Control for Dance: Principles and ...

Motor learning is a subdiscipline of motor behavior that examines how people acquire motor skills. Motor learning is a relatively permanent change in the ability to execute a motor skill as a result of practice or experience. This is in contrast to performance, the act of executing a motor skill that results in a temporary, nonpermanent change. One way to conceptualize this difference is to consider the change of state in an egg (Schmidt & Lee, 2014).
