Care homes: infection prevention and control - GOV.UK
MRSA in primary care: Summary Staphylococcus aureus (S. aureus) is a bacteria which colonises the skin, nose or gut of up to a third of the general population — it usually lives on intact skin harmlessly but can cause infection (most commonly skin, soft tissue, and bone infection) if invasion through the skin or deeper tissues occurs.

MRSA in primary care | Topics A to Z | CKS | NICE
People taking care of patients suffering from MRSA infections should wear protective garments and follow strict hand hygiene procedures. Contaminated surfaces and laundry items of infected persons should be properly disinfected. Clean infected areas daily with hot water and soap to fight the infection and prevent it from spreading.

How to Treat a MRSA Infection Naturally | Top 10 Home Remedies
Follow appropriate infection control measures (in line with local policy) in all cases of suspected or confirmed MRSA infection. Reducing transmission involves strict adherence to basic infection-control principles (particularly hand hygiene), whether a person is known to be colonized with meticillin-resistant Staphylococcus aureus (MRSA) or not, and careful communication between healthcare professionals.
