The identification of relevant psychosocial factors may improve the assessment of chronic cancer pain. This article presents: 1) a critical review of the evidence for an association between chronic cancer pain and psychological distress, social support, and coping; 2) clinical implications of the findings; and 3) recommendations for future research.

Cancer Pain and Psychosocial Factors: A Critical Review of ...

The focus of primary care is to relieve the symptoms associated with the acute pain condition while increasing movement and functionality in the affected area. 26 In general, the psychological factors addressed in primary care settings correspond to alleviating any anxiety or fear associated with the occurrence of pain. At this phase, it is important to educate the patient about medication compliance and following the prescribed exercise protocol in order to expedite the healing process.

This model is commonly used in chronic pain, with the view that the pain is a psychophysiological behaviour pattern that cannot be categorised into
biological, psychological, or social factors alone. There are suggestions that physiotherapy should integrate psychological treatment to address all
components comprising the experience of chronic pain .

psychosocial factors in pain critical perspectives

Psychosocial Factors in Musculoskeletal Disorders. Work-related musculoskeletal disorders (MSD) have a multifactorial etiology that includes not only physical stressors but also psychosocial risk factors, such as job strain, social support at work, and job dissatisfaction. Once an injury has occurred, psychosocial factors, such as depression and maladaptive pain responses, are pivotal in the transition from acute to chronic pain and the development of disability.
