RAILWAY ELECTRIFICATION 9.1 Introduction despite the competition of airplanes, buses, trucks and cars, trains still play a major transportation role in society, filling specific markets such as high-speed and non-high-speed intercity passenger service, heavy haul of minerals and freight, urban light rail systems and commuter rail. This chapter presents an introduction to electrification of rail systems.

Railway Electrification 9 1 Introduction D

In the wake of the electrification of Tyneside by the NER, this coal-carrying line was electrified between 1 July 1915 and 1 January 1916 as a planned precursor to electrifying NER's busy York to Newcastle main line (part of the East Coast Main Line). The LNER removed this electrification system in 1935 (between 7 January and 8 July); the decline in the coal market making it economically unfeasible to undertake the significant renewals required to continue electric operation.

Electrification codes introduction - Railway codes

A third of Britain's railway is already powered by electricity and 27% of Wales' railway will be electrified by 2020. More rail routes are being electrified to make journeys faster, greener and more reliable. Electrification will improve travel between major cities and is vital in supporting economic growth.

tEACHiNG PAcK - Network Rail

While the former Soviet Union got a late start with rail electrification in the 1930s it eventually became the world leader in electrification in terms of the volume of traffic under the wires. During its last 30 years the Soviet Union hauled about as much rail freight as all the other countries in the world combined and in the end, over 60% of this was by electric locomotives. Electrification was cost effective due to the very high density of traffic and was at times projected to yield at least
