These results were...

~~(PDF) Reaction Kinetics of the Iodination of Acetone~~

Kinetics I - The Iodination Of Acetone Determining the Rate Constant for a Chemical Reaction The rate of a chemical reaction depends on several factors: the nature of the reaction, the concentrations of the reactants, the temperature, and the presence of a possible catalyst. In Part One of this experiment we will

~~CH 222 Winter 2021: Kinetics I – The Iodination Of Acetone ...~~

Kinetics of the iodination of acetone Lab report By Jahaira Barragan Chem 1008-476 10/06/2020 Abstract: Chemical kinetics is used to measure the rate of the reaction. Reactions can be affected by many conditions such as change in temperature, concentration over time, change in surface area, and temperature. In this experiment we found that the rate of the reaction increased if the concentration was increased and if there was a used of a catalyst.

~~lab 3 report.docx – Kinetics of the iodination of acetone ...~~

The results agree with the established notion that the order with respect to the concentration of iodine is zero order. Introduction. Kinetics is a subfield that studies the rate and mechanism for a chemical reaction. The mechanisms are the species involved, and how many of each species are involved in a reaction.

~~Reaction Kinetics: The Iodination of Acetone I~~

earlier and it has been found that the reaction is zero order with respect to iodine. The overall stoichiometric equation for the iodination is:-  $\text{CH}_3\text{COCH}_3 + \text{I}_2 \rightarrow \text{CH}_3\text{COCH}_2\text{I} + \text{HI}$  (1) If this represented the mechanism of the reaction, the rate of reaction would be proportional to both the acetone and iodine concentrations.

~~Kinetics of iodination of acetone, catalyzed by HCl and H<sub>2</sub>SO<sub>4</sub>~~

Changing the type of ketone in the reaction to butanone will prevent this haloketone from being produced, however the new ketone has a different chain length and therefore there is a need to test if there is a significant difference between the rates of the reaction the iodination of propanone and the iodination of butanone.

~~Kinetics: The Iodination of Propanone – UKEssays.com~~

The rate of iodination of acetone has been measured as a function of temperature in the binary solvent isobutyric acid (IBA) + water near the upper consolute point. The reaction mixture was prepared by the addition of acetone, iodine, and potassium iodide to IBA + water at its critical composition of 38.8 mass % IBA.

~~Reaction Kinetics and Critical Phenomena: Iodination of ...~~

The rate law for acetone iodination is  $\text{rate} = k [\text{Acetone}] [\text{H}^+]$ . The average value of k calculated from the three trials was found to be about  $2.32 \times 10^{-5} \text{ M}^{-1} \text{ s}^{-1}$ . ## ~~Chemical Kinetics: The Iodination of Cyclohexanone Lab #5 ...~~

The rate law expression for this reaction is:  $\text{rate} = k[\text{acetone}]^m[\text{I}_2]^n[\text{H}^+]^p$  where m, n, and p are the orders of the reaction with respect to acetone, iodide, and hydrogen ion, respectively, and k is the rate constant for the reaction. The iodination of acetone can be investigated experimentally because, iodine has color so that we can readily follow the changes in iodine concentration visually, A.

## ~~Solved: A Lab On Kinetics Of The Iodination Of Acetone. I ...~~

$\text{CH}_3\text{COCH}_3(\text{aq}) + \text{I}_2(\text{aq}) \rightleftharpoons \text{CH}_3\text{COCH}_2\text{I}(\text{aq}) + \text{H}^+(\text{aq}) + \text{I}^-(\text{aq})$  However, the rate expression is:  $\text{rate} = k[\text{CH}_3\text{COCH}_3(\text{aq})][\text{H}^+(\text{aq})]$  and iodine is not in the rate expression but one of the products is! Therefore the reaction is zero order for iodine and it also zero order for bromine in the similar bromination reaction.

Kinetics of the Iodination of Aniline BY ERNST BERLINER From a study of the kinetics of the iodination of phenol in water Painter and Soper concluded that the reaction takes place either between phenol and hypiodous acid, or between the phenoxide ion and the positive iodine ion ( $\text{I}^+$ ).l Since the

## ~~CHEMICAL KINETICS: SECOND ORDER REACTION IODINATION OF ...~~

The rate, rate law and activation energy of the iodination of acetone are determined by observing the disappearance of the characteristic color of iodine in water. By systematically varying the concentration of reactants, the rate law is determined to be:  $\text{Rate} = k[\text{acetone}][\text{H}^+]$

## ~~Rate and Activation Energy of the Iodination of Acetone~~

In this experiment we will study the kinetics of the reaction between iodine and acetone:  $\text{CH}_3\text{COCH}_3 + \text{I}_2(\text{aq}) + \text{H}^+(\text{aq}) \rightarrow \text{CH}_3\text{COCH}_2\text{I} + \text{HI}(\text{aq})$  The rate of this reaction is found to depend on the concentration of the hydrogen ion (acid, HCl) as well as the concentrations of the reactants (acetone and iodine). The rate law for this reaction is

## ~~THE IODINATION OF ACETONE – MhChem~~

The purpose of this experiment is to determine the rate law for the reaction of iodine with acetone. In order to determine the rate law, we will use initial rates. Since this is an iodination of acetone experiment, the initial rate would be the time it takes for the brownish color of iodine to turn clear.
