Conclusions: Lactobacillus spp. and Pediococcus spp. possess varying degrees of α and β D-glucopyranosidase activities, which in turn are influenced differently by exposure to ethanol and/or sugars, temperature and pH. Several strains appeared suited for further evaluation under winemaking conditions.

Hence in the present study, the isolation and screening of Lactobacillus spp.(Gram-positive commensal inhabitants of the gastrointestinal tract that also play important roles in the production and preservation of food) was carried to explore their capabilities of biosynthesizing silver nanoparticles which have exceptional antimicrobial activity against broad spectrum Gram-negative and Gram-positive bacteria.

AIMS: To assess glycosidase activities from a range of Lactobacillus and Pediococcus species and characterize these activities under conditions pertinent to the wine industry. METHODS AND RESULTS: Lactic acid bacteria were cultured in MRS broth supplemented with apple juice before being harvested, washed and assayed for glycosidase activity using p-nitrophenol-linked substrates.

ABSTRACT. The probiotic potential of 47 selected strains of Lactobacillus spp. was investigated. The strains were examined for resistance to pH 2.5 and 0.3% oxgall, adhesion to Caco-2 cells, and antimicrobial activities against enteric pathogenic bacteria in model systems. From the results obtained in vitro, five strains, Lactobacillus rhamnosus 19070-2, L. reuteri DSM 12246, L. rhamnosus LGG, L. delbrueckii subsp. lactis CHCC 2329, and L. casei subsp. alactus CHCC 3137, were selected for in ...
