Sedimentology explores the origin, transport, deposition and diagenetic alterations of the materials that compose sediments and sedimentary rocks. **Stratigraphy** investigates how those types of rocks are accumulated and distributed in space and time.

As nouns the difference between stratigraphy and sedimentology is that stratigraphy is (geology) the study of rock layers and the layering process (stratification) while sedimentology is (geology) the study of natural sediments and of the processes by which they are formed.

Sedimentary rocks contain the most important archive of environmental change through earth history. They record changing climates, the movement of plates, and the rise and fall of sea-level on timescales of a few thousand to billions of years.

Sequence stratigraphy is a method for stratigraphic interpretation, pioneered by Vail and colleagues in the mid 70's, which explains the complex geometries that sediments create as they fill accommodation in response to changes in rates of sedimentation, subsidence, uplift and eustasy. This method was developed based on observations and concepts developed as early as in the 1800's. Based
