The technique of pars plana vitrectomy (PPV) was first reported in 1971 by Machemer et al. using 17G instruments to clear diabetic vitreous haemorrhage.4Although the technique has since evolved considerably, the basic goal of removing vitreous to relieve retinal traction and clearopacities remains the same.

Diabetic Vitrectomy - An Update - touchOPHTHALMOLOGY

At a Glance. • The 27-gauge vitreous cutter is the best device for membrane dissection in diabetic eyes because it can be easily inserted between membranes. • An improved, high-speed 27-gauge vitrectomy system offers anatomic success in patients with diabetic TRD similar to that of 23- and 25-gauge systems. • Surgical procedures are simplified and operating times are shortened with the 27-gauge system.

Small-Gauge Vitrectomy for Diabetic Retinopathy will be an ideal source of information and guidance for all who are embarking upon such surgery or wish to further hone their skills. About the Author Ulrich Spandau studied medicine at the University of Würzburg in Germany before completing residencies in the Departments of Ophthalmology at the University of Heidelberg and the University of Mannheim-Heidelberg.

Small-Gauge Vitrectomy for Diabetic Retinopathy ...

Small gauge vitrectomy surgery, which sometimes is referred to as minimally invasive vitreous surgery or MIVS, is an operation performed by a retinal specialist to treat a multitude of retinal conditions including retinal detachments, macular holes, vitreous hemorrhages, epiretinal membranes and more. Small gauge vitrectomy is a newer eye surgical operation that uses, as one would understand, smaller instruments to perform the surgery.

Previous studies into small gauge surgery for diabetic vitrectomy have compared rates of POVCH between 20g and 23g systems, or evaluated a specific gauge independently. POVCH has been reported as being more frequent with larger gauge instruments. Yang et al recorded a one month re- bleed rate of 18% in 20g and 7% in 25g.
