Downy mildews (Peronosporales) are biotrophic Oomycetes that are characterized by the formation of white, downy sporangiophores on the surface of infected hosts. The white rusts (*Albugo* spp.) produce chains of sporangia that erupt through the cuticle of infected hosts. The Downy Mildews Biology Mechanisms

Knowledge of downy mildew pathogens and diseases has increased significantly in taxonomy, phylogeny, genetics, molecular biology, host-parasite interactions, ecology, epidemiology and control. The opportunity to update comprehensively the major advances in these areas was created by the 2nd International Symposium on Downy Mildews held in July 2007 at Olomouc (Czech Republic).
