The Apache web server
service is called httpd on
Red Hat based distros like
CentOS, while it is called
apache2 in Debian based
distros. If you are using a
firewall like iptables, you

should add a rule for port 80. $ iptables -I INPUT 1 -m state --state NEW -m tcp -p tcp --dport 80 -j ACCEPT

Install, Configure, and Troubleshoot Linux Web Server ...

echo "cd /var/log/apache2 && grep -nr KeepingUpSampleChapter" \ | ssh -i PrivateKey.pem LoginName@bootstrap-it.com Let's break that down. The first of the two commands in quotation marks (cd /var/log/apache2) will move us to the /var/log/apache2/ directory on the Linux server where Apache writes its logs. That's not rocket science.

How to Quickly Track PDF Access on a Linux Web Server
In this tutorial we create a (power) user, we install Apache, PHP and MySQL, phpMyAdmin and several other services needed to run a powerful and secure web server. Preparations. First you need a web server (VPS or a dedicated server). Try to get a cloud server, they are very powerful, redundant and flexible. Choose a Linux image like Ubuntu 10.04 LTS and validate that the SSH server is up and running. Don't use an image where any web service is pre-installed. Creating the "Admin" user
