~~to von Neumann's Theory of Self-Reproducing Automata. Consider a digital computer or automaton which operates synchronously and which is composed entirely of switches ("and," "or," and "not") and delays (which delay pulses for one time unit). We will refer to these idealized elements as computing elements.~~

~~Theory of self-reproducing automata | John von Neumann - -~~

~~In Theory of Self-Reproducing Automata, von Neumann described a cellular automaton with twenty-nine possible states for each cell and in which every cell is connected to the cell above, below, left, and right (called a "von Neumann" neighborhood).~~

~~John von Neumann's Cellular Automata | The Embryo Project - -~~

~~Von Neumann cellular automata are the original expression of cellular automata, the development of which was prompted by suggestions made to John von Neumann by his close friend and fellow mathematician Stanislaw Ulam. Their original purpose was to provide insight into the logical requirements for machine self-replication, and they were used in von Neumann's universal constructor. Nobili's cellular automaton is a variation of von Neumann's cellular automaton, augmented with the ability for confl~~

~~Von Neumann cellular automaton - Wikipedia~~

~~John von Neumann's universal constructor is a self-replicating machine in a cellular automata environment. It was designed in the 1940s, without the use of a computer. The fundamental details of the machine were published in von Neumann's book Theory of Self-Reproducing Automata, completed in 1966 by Arthur W. Burks after von Neumann's death. While typically not as well known as von Neumann's other work, it is regarded as foundational for automata theory, complex systems, and artificial life. In~~

~~Viewing the logic of self-replication and self-reproduction through the lens of formal logic and and self-referential systems, von Neumann applied the results of Gödel and Turing to the foundations of biology" with his conjectures hitting "the heart of the probability or improbability of the origin of life" (Dyson, Turing's Cathedral, pp. 283-285).~~

~~Theory of Self-Reproducing Automata (22)~~

~~(p28) Von Neumann found an analog of thermodynamic degeneration in the theory of self-reproducing automata: below a certain minimum level, complexity and degree of organization are degenerative, but above that level they are not degenerative and may even increase.~~

~~John von Neumann, Arthur W. Burks - Theory of self - -~~

~~The von Neumann generation rank and information thresholds are computed for this example, and are consistent with the simulation results in predicting degeneracy in the case without error correction, and predicting successful self-reproduction in the case with error correction.~~

~~The von Neumann threshold of self-reproducing systems - -~~

~~(485) [von Neumann's early model of self-reproduction deals with the geometrical-kinematic problems of movement, contact, positioning, fusing, and cutting, and ignores the truly mechanical and chemical questions of force and energy. Hence I call it his kinematic model of self-reproduction.~~
