Thyroid cancer was discovered in several patients, allowing for appropriate treatment of both thyroid and parathyroid disease with a single operation. Experts at the Cleveland Clinic conducted a similar study in which they found that routine pre-operative ultrasound evaluation actually reduced the need for unnecessary thyroid surgery.

Doctors measure the parathyroid hormone and the calcium hormone to diagnose hyperparathyroid disease. If both are elevated, that indicates a tumor (adenoma) is growing. An adenoma might still be growing if the parathyroid hormone level is normal. A Sestambi Scan helps to identify which parathyroid gland is diseased.

Parathyroid disease affects the parathyroids, four pea-sized glands located in the neck near the thyroid. The glands produce parathyroid hormone (PTH). PTH helps maintain the correct balance of calcium in the body. Normally, the glands release just enough PTH to keep calcium levels normal. Disease upsets this delicate balance. There are three types of parathyroid disease: hyperparathyroidism, parathyroid cancer and hypoparathyroidism. Hyperparathyroidism

[Parathyroid disease- what is it and how is it treated?](#)

Parathyroid Disease. Though the four tiny glands known as the parathyroid function separately from the thyroid, when they develop problems, the culprit is the same as with thyroid disease: EBV. Together, these glands, which are each about the size of a shelled sunflower seed, are responsible for keeping calcium levels balanced in the body—basically, they regulate calcium levels in the bloodstream.

Chronic kidney failure is the most common cause of secondary hyperparathyroidism. Some medical treatments, such as vitamin D, bisphosphonates and cinacalcet, will lower PTH levels. In some people with long-term end-stage kidney disease, the parathyroid glands enlarge and begin to release PTH on their own, and PTH doesn't go down with medical treatment. This is called tertiary hyperparathyroidism, and people with this condition may require surgery to remove parathyroid tissue.

The parathyroid glands make parathyroid hormone (PTH), which helps your body keep the right balance of calcium and phosphorous. If your parathyroid glands make too much or too little hormone, it disrupts this balance. If they secrete extra PTH, you have hyperparathyroidism, and your blood calcium rises.
