Background and objectives: Ultrasound-guided techniques for pudendal nerve block have been described at the level of the ischial spine and transperineally. Theoretically, however, blockade of the pudendal nerve inside Alcock canal with a small local anesthetic volume would minimize the risk of sacral plexus blockade and would anesthetize all 3 branches of the pudendal nerve before they ramify ...

Compared with caudal block, ultrasound-guided pudendal nerve block is safe, provides equivalent pain control for hypospadias repair, and results in a shorter time to discharge. Ultrasound-guided Pudendal Block Is a Viable Alternative to Caudal Block for Hypospadias Surgery: A Single-Surgeon Pilot Study

Transperineal pudendal nerve block guided by nerve stimulator is used in pediatric anesthesia as an alternative to caudal analgesia in perineal surgery. The risk of rectal puncture or intravascular injection is inherent to this blinded technique. We described a new technique of transperineal pudendal nerve block, with ultrasound guidance, to improve safety of the technique.

Ultrasound-Guided Pudendal Nerve Block. Background and indications: Pudendal neuralgia refers to chronic pelvic pain where pain is experienced in the regions innervated by the pudendal nerve, 1 specifically the clitoris, penis, and perianal area. 1, 2 and 3 Its prevalence is estimated at approximately 1% of the general population, 4 with a female to male preponderance of 2.5:1. 5 The pain is typically burning or tingling in character, and it affects either the entire area supplied by the ...

Blockade of the pudendal nerve (PN) using ultrasound (US) guidance has been described at the levels of the ischial spine and Alcock's canal. However, no study has been conducted to compare anatomical accuracy between different approaches in targeting the PN.

Techniques for pudendal nerve blocks described include: 1. anatomical landmarks 15; 2. neurostimulation^{6, 66}; 3. fluoroscopy 49; 4. tomography^{67, 68, 69}; and, more recently, blockage guided by ultrasound.^{1, 7, 49, 59, 70, 71, 72} We believe that ultrasound is better than other techniques in terms of practical use and results 71 and, therefore, we will focus on the sonoanatomic descriptions that enable a refined and reproducible practice in order to increase the frequency of success in terms ...

Nerve blocks are injected near the nerves using ultrasound. There are three types of PNBs: Lower extremity nerve blocks; Nerve blocks of the abdomen and thorax; Upper extremity nerve blocks; PNBs for acute pain can be administered in two ways: as a single shot injection and via continuous catheters.

Pudendal Nerve Block Linear ultrasound probe and the sacral hiatus at the sacral cornu level was visualized using an out-of-plane transverse view at 5-10 megahertz . The linear probe was then rotated 90 degrees and placed longitudinally in the midline to evaluate the sacral cornus, sacrococcygeal ligament and sacral bone.

~~Introduction to Ultrasound Guided Regional Anesthesia — NYSORA~~

Pudendal nerve infiltrations are essential for the diagnosis and the management of PN. The purpose of this study was to compare the effectiveness of finger-guided transvaginal pudendal nerve infiltration (TV-PNI) technique and the ultrasound-guided transgluteal pudendal nerve infiltration (TG-PNI) technique.

~~Comparison of Ultrasound Guided Transgluteal and Finger ...~~

Ultrasound-guided transgluteal (TG) PNI has been described to reach the pudendal nerve in the plane between the sacrotuberous and sacrospinous ligaments. This technique has many advantages such as visualization of the substantial structures (pudendal artery and the sciatic nerve) without radiation exposure it enables real-time images.

Ultrasound-Guided Technique The US-guided technique is the same as that used for adults (see Nerve Blocks of the Face). A linear probe of 10 MHz or more is used to identify the obliquus capitis, and the nerve can be found superficial to the muscle.
