~~Whats In Your Genes From~~

When someone tells you, “It’s in your genes,” they’re saying that the part of your chromosome responsible for your quirk matches that part of the chromosome on your equally quirky parent. Except when it doesn’t. Imagine two mice. One looks normal. It’s tiny and brown. The other is fat and has orange fur.

~~What's on your genes? | Science News for Students~~
Genes and Chromosomes. To understand how genes work, it’s important to understand what they are. Every human being has 23 pairs of chromosomes – for a total of 46 individual chromosomes. You inherit one pair from your mother and one from your father. [2] Each individual chromosome is like a backpack filled with genes.

~~What's In Your Genes?—Read and Digest~~
DNA (deoxyribonucleic acid) carries the genetic information in your body’s cells. DNA is made up of four similar chemicals—adenine, thymine, cytosine, and guanine—which are called bases and abbreviated as A, T, C, and G. These bases are repeated over and over in pairs to make up your DNA.

~~Overview of Genes, DNA, and Chromosomes~~
Genealogy and genetics are two different fields of study that have become very overlapped in recent years. In addition to creating a family tree, many genealogists are making a

genetic Having to do with chromosomes, DNA and the genes contained within DNA. The field of science dealing with these biological instructions is known as genetics. People who work in this field are geneticists. genome The complete set of genes or genetic material in a cell or an organism. The study of this genetic inheritance housed within cells is known as genomics.

~~Explainer: What are genes? | Science News for Students~~

Genes are made up of DNA. Some genes act as instructions to make molecules called proteins. However, many genes do not code for proteins. In humans, genes vary in size from a few hundred DNA bases to more than 2 million bases.

The chromosomes and genes are made of DNA, which is short for deoxyribonucleic (say: dee-ox-see-ri-bo-nyoo-CLAY-ik) acid. Most cells have one nucleus (say: NOO-clee-us). The nucleus is a small egg-shaped structure inside the cell which acts like the brain of the cell. It tells every part of the cell what to do.

Genes are your body's blueprint. They carry the instructions for producing (expressing) all of the many proteins in your body that determine how you look and how your body works. Your genes are...

~~Genes and Health: What Did You Inherit From Your Mother?~~

DNA: it's not just what's in your genes... The field of genetics has come on leaps and bounds in recent years, with breakthroughs such as the identification of genes associated with increased obesity. However, the DNA sequence is not the be-all and end-all of disease risk. Our speakers will discuss the current knowledge of inherited variation, and how this affects our lives, as well as the newer field of epigenetics, and how this relates.
